

## D30 Data from 97 recalculated Lili Kolisko curves

(from her book “Physiological and Physical Proof of the Effect of the smallest Entities”)

The graph below demonstrates how different the effect of a D30 potency of different substances can be on the vitality of etheric forces – demonstrated here as an increase or decrease in the growth of wheat seeds. Rudolf Steiner called the increase in growth as a proof of “vitalizing” of the etheric force.

Substances like iron, magnesium and bismuth (on the left side of the curve) enhance the growth around 80% over the control. On the other hand substances like Achillea Millefolium or annagallis (on the right side) inhibit the growth by about 75% compared to control.

Finally, Bryonia D30 seems to not have affected the plant growth at all – the difference to control is zero.

It is based on this type of historical data that has given us the impetus to research anew many of the potentized substances commonly in use.

Might this be the reason why sometimes a given potency does not have the desired effect - since it does not have the sought after influence on the etheric body?

This gives us a very good rationale to obtain reliable potency curves for all substances.

It certainly was Lili Kolisko’s hope.
